

ReactJS HOL 16 – Mail Registration

In this exercise, I created a Mail Registration form using React Hooks. The form accepts the user's email, password, and confirm password. When the Register button is clicked, it checks whether both passwords match. If they match, a success message is displayed with the registered email address.

Source Code

App.js

```
import './App.css';

import Register from './register';

function App() {

  return (

    <div>

      <Register />

    </div>

  );

}

export default App;
```

register.js

```
import { useState } from 'react';

function Register() {

  const [email, setEmail] = useState('');

  const [password, setPassword] = useState('');

  const [confirmPassword, setConfirmPassword] = useState('');

  const handleSubmit = (event) => {

    event.preventDefault();

    if (password === confirmPassword) {

      alert(`Registration Successful for ${email}`);

    } else {

      alert("Passwords do not match");

    }

  }

}
```

```
}  
};  
return (  
  <div style={{ margin: "30px" }}>  
    <h1 style={{ color: "blue" }}>Mail Registration</h1>  
    <form onSubmit={handleSubmit}>  
      <div>  
        <label>Email:</label>  
  
        <br />  
  
        <input  
          type="email"  
          value={email}  
          onChange={(e) => setEmail(e.target.value)}  
          required  
        />  
      </div>  
  
      <br />  
  
      <div>  
        <label>Password:</label>  
  
        <br />  
  
        <input  
          type="password"  
          value={password}  
          onChange={(e) => setPassword(e.target.value)}  
          required  
        />  
      </div>  
  
      <br />  
  
      <div>
```

```

    <label>Confirm Password:</label>

    <br />

    <input
      type="password"
      value={confirmPassword}
      onChange={(e) => setConfirmPassword(e.target.value)}
      required
    />
  </div>

  <br />

  <button type="submit">Register</button>
</form>
</div>

);
}

export default Register;

```

Figure 1: Project Structure

Figure 2: Browser Output

localhost:3000

Mail Registration

Email:

Password:

Confirm Password:

Figure 3: Registration Successful

localhost:3000

Mail Registration

Email:

Password:

Confirm Password:

localhost:3000 says
Registration Successful for kundana@gmail.com

Figure 4: Terminal Output

```
PROBLEMS  TERMINAL  ...  node  +  -  [ ]  [ ]  ...  |  [ ]  x
PS C:\Users\HP\OneDrive\Documents\mailregisterapp> npm start

You can now view mailregisterapp in the browser.

Local:      http://localhost:3000
On Your Network: http://192.168.1.35:3000

Note that the development build is not optimized.
To create a production build, use npm run build.

webpack compiled successfully
```

Result

The Mail Registration application was implemented successfully using React Hooks. The registration form accepted user input, validated the passwords, and displayed a success message when the registration was completed successfully.
