

ReactJS HOL 17 – Fetch User Details from REST API

In this exercise, I created a React application that consumes a REST API using the `fetch()` method. The application retrieves a random user's details from `https://api.randomuser.me/` inside the `componentDidMount()` lifecycle method and displays the user's title, first name, and profile picture.

Source Code

App.js

```
import './App.css';

import Getuser from './Getuser';

function App() {

  return (

    <div>

      <Getuser />

    </div>

  );

}

export default App;
```

Getuser.js

```
import React, { Component } from "react";

class Getuser extends Component {

  constructor(props) {

    super(props);

    this.state = {

      person: {}

    };

  }

  async componentDidMount() {

    const response = await fetch("https://api.randomuser.me/");
```

```

const data = await response.json();

this.setState({
  person: data.results[0]
});
}

render() {
  const { person } = this.state;

  return (
    <div style={{ textAlign: "center", marginTop: "30px" }}>
      <h1>Random User Details</h1>
      {person.name && (
        <>
          <img
            src={person.picture.large}
            alt="User"
            style={{ borderRadius: "50%" }}
          />
          <h2>
            {person.name.title} {person.name.first}
          </h2>
        </>
      )}
    </div>
  );
}

export default Getuser;

```

Figure 1: Project Structure

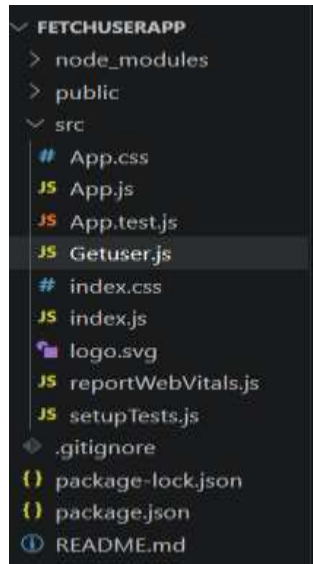

Figure 2: Browser output

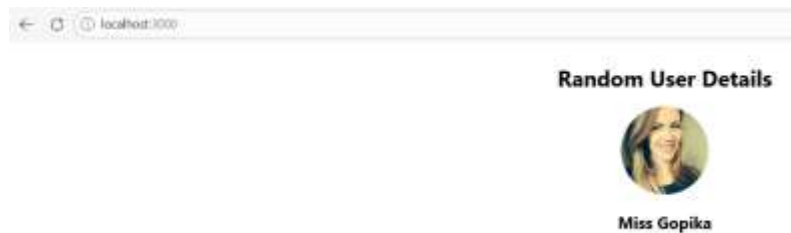

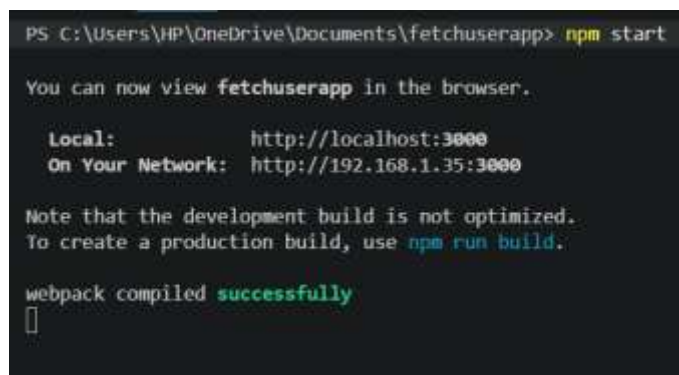

Figure 3: Terminal output

Result

The React application successfully consumed the REST API using the `fetch()` method in the `componentDidMount()` lifecycle method. The application retrieved and displayed the random user's title, first name, and profile picture successfully.
