

ReactJS HOL 11

Event Handling in React

In this exercise, I developed a React application named **eventexamplesapp** to understand event handling in React. I implemented different event handlers such as Increment, Decrement, Say Welcome, Click on Me, and a Currency Converter using form submission. The application successfully demonstrated button click events, synthetic events, passing arguments to event handlers, and handling form events using React.

CurrencyConvertor.js

```
import React from "react";

function CurrencyConvertor() {

  const handleSubmit = (event) => {

    event.preventDefault();

    const amount = event.target.amount.value;

    const currency = event.target.currency.value;

    const euroAmount = amount * 80;

    alert(`Converting to ${currency} Amount is ${euroAmount}`);

  };

  return (

    <div>

      <h1 style={{ color: "green" }}>

        Currency Convertor!!!

      </h1>

      <form onSubmit={handleSubmit}>

        <table>

          <tbody>

            <tr>

              <td>Amount:</td>

              <td>

                <input

                  type="text"
```

```
        name="amount"

    />
</td>
</tr>
<tr>
    <td>Currency:</td>
    <td>
        <input
            type="text"
            name="currency"
        />
    </td>
</tr>
<tr>
    <td></td>
    <td>
        <button type="submit">
            Submit
        </button>
    </td>
</tr>
</tbody>
</table>
</form>
</div>

);
}

export default CurrencyConvertor;
```

App.js

```
import './App.css';

import React, { useState } from 'react';

import CurrencyConvertor from './CurrencyConvertor';

function App() {

  const [count, setCount] = useState(0);

  const increment = () => {

    setCount(count + 1);

  };

  const decrement = () => {

    setCount(count - 1);

  };

  const sayHello = () => {

    alert("Hello! Member1");

  };

  const increase = () => {

    increment();

    sayHello(); };

  const sayWelcome = (message) => {

    alert(message);

  };

  const onPress = () => {

    alert("I was clicked");

  };

  return (

    <div>

      <h3>{count}</h3>

      <button onClick={increase}>

        Increment

      </button>

    </div>

  );

}
```

```

    </button>

    <br /><br />

    <button onClick={decrement}>

      Decrement

    </button>

    <br /><br />

    <button onClick={() => sayWelcome("welcome")}>

      Say welcome

    </button>

    <br /><br />

    <button onClick={onPress}>

      Click on me

    </button>

    <br /><br />

    <CurrencyConvertor />

  </div>

);
}

export default App;

```

Result

The React application was implemented successfully to demonstrate event handling concepts. Different button click events, synthetic events, passing arguments to event handlers, and form submission events were implemented successfully. The application produced the expected output and all event handlers executed correctly.
